

EXISTING SYSTEM

- ❖ **Vehicle Tracking:** Real-time GPS tracking allows for precise monitoring of vehicle locations, reducing the risk of loss or theft.
- ❖ **Unified Platform:** The system consolidates all vehicle-related data and operations into a single platform, making it easier to manage and access information.
- ❖ **Real-Time Data:** Provides real-time updates on vehicle status, inventory levels, and sales data, ensuring that all stakeholders have the most current information
- ❖ **Maintenance Scheduling:** Automated maintenance reminders and scheduling help keep vehicles in optimal condition, reducing downtime and maintenance costs
- ❖ **Compliance Management:** Ensures that all vehicles meet regulatory requirements, reducing the risk of fines and legal issues.
- ❖ **Driver Safety Monitoring:** Features like real-time driver tracking and safety alerts help maintain high safety standards.
- ❖ **Fuel Management:** Real-time fuel tracking and diagnostics help reduce fuel consumption and associated costs.

INTRODUCTION

The YOUR VEHICLE is a mobile application developed in Android studio using java language, designed to streamline vehicle information of the user. It offers a user-friendly interface for both administrators and end-users, with features including comprehensive vehicle inventory management, automated maintenance reminders, real-time GPS tracking, and customer relationship management. The system enhances operational efficiency through centralized management and real-time data updates, improves customer satisfaction with personalized accounts, and ensures safety with real-time monitoring and alerts. By providing detailed reporting and analytics, it helps users to store and retrieve his/her vehicle information through the application, making it a robust and scalable solution for user's vehicles of all sizes.

TECHNOLOGY STACK –

Front End : Android Studio (Java)

Back End : SQLite, Firebase

Software and Hardware Requirements:

Software Requirements:

Operating System: Windows 11 Software:

Android Studio (Java)

Database: SQLite, Firebase

Hardware Requirement:

**Processor: Intel(R) Core (TM) i5–8250U CPU @ 1.60GHz
1.80 GHz**

RAM: 16.00 GB 64-bit operating system.

SYSTEM DESIGN

1.ER-Diagram(Entity Relation ship Diagram)

2.DFD (Data Flow Diagram)

LIMITATIONS OF THE SYSTEM:

1.Security Concerns

- **Data Breaches and Unauthorized Access:** Like other online platforms, Personal Vehicle Management System are susceptible to cybersecurity threats. Sensitive customer information, such as personal details and payment information, can be exposed through data breaches or unauthorized access. This can lead to financial fraud and identity theft.

2.Technical Issues

- **System Downtime and Performance:** Technical problems like website downtime, slow loading times, or glitches can negatively impact the user experience. These issues can lead to customer frustration and lost business opportunities.

3.Lack of Physical Interaction

- **Assessing Vehicle Quality:** Customers cannot physically see, touch, or test drive vehicles before making a purchase or rental. This limitation can make it difficult for buyers to assess the quality, size, fit, or feel of a vehicle, leading to higher return rates.

4.Fraud and Scams

- **Trust and Integrity:** The online environment can be prone to fraudulent activity, such as fake listings or sellers who

do not fulfil their commitments. This can erode customer trust in the platform.

5. Dependence on Technology

- **Technical Failures:** The system relies heavily on technology infrastructure. Any technical failure, such as server crashes or software bugs, can halt operations, resulting in significant revenue loss.

FUTURE ENHANCEMENTS:

1. Personalized Experience-

- **AI-Powered Recommendations:** Use AI algorithms to recommend searching based on browsing history, and user preferences.
- **Customized UI:** Allow users to customize their viewing interface (themes, layout) for a more personal experience.

2.Advanced Search and Filtering

- **Voice Search:** Integrate voice-enabled search for a hands-free search experience.

3.Improved customer support

- **24/7 Chatbots with NLP:** Use natural language processing (NLP) in AI chatbots to answer customer queries more efficiently and effectively.

4.Security Enhancement

- **Biometric Authentication:** Implement biometric security (fingerprint, facial recognition) for logging in, adding an extra layer of security.
- **Fraud Detection Systems:** Use AI to detect and prevent fraudulent activities by analysing Bot logging.

5. Cross Platform Integration:

- **Social INFO:** Integrate our app experiences into social media platforms (Instagram, Facebook) where users can view our app preference.

6. Vehicle Information

- Our app will specialize in Various vehicle Information Display where the user can view vehicle's Important feature that He/she could see before buying any vehicle but only the Information not the Price.

7. ChatBOT

- A chatbot in a car management system app offers quick assistance for car info searches and settings help, making the app more user-friendly and efficient. It also provides instant support for troubleshooting common issues, enhancing overall user satisfaction.

CONCLUSION:

The project titled Personal Management System has been successfully completed. The system has been meticulously developed to be error-free, efficient, and time-saving. The primary objective was to create a comprehensive web application for managing various aspects of a car care. Through this project, we have gained valuable insights and practical knowledge in several key areas, including designing user-friendly interfaces using JAVA, implementing responsive design templates, and managing databases with SQLite. The entire system is secured to ensure data integrity and privacy.

Additionally, the project has provided us with a deeper understanding of the software development life cycle, allowing us to make simple modifications and improvements. There is ample scope for further development and enhancement. We have also learned how to thoroughly test different features of the system to ensure its reliability and functionality. This project has given us great satisfaction in developing an application that can be easily implemented by car care that can be used by many users. In the future, numerous features can be added to this system, such as providing administrators with more control over vehicle listings, enabling each administrator to manage their own fleet of cars.

BIBLIOGRAPHY

1.Registration Page: -

The image shows a mobile application registration page. At the top, there is a status bar with the time 8:21, a user profile icon, a signal strength indicator, a Wi-Fi icon, and a battery level of 88%. Below the status bar, the background features a blue and white geometric pattern with diagonal lines. In the center, there is an illustration of a black semi-truck, a white sedan, a white SUV, and a black motorcycle. Below the illustration, the text "SignUP" is displayed. Underneath, there are four rounded rectangular input fields for "User Name", "Email", "Password", and "Confirm Password". At the bottom, there is a large blue button labeled "SIGNUP" and a smaller blue button labeled "ALREADY HAVE AN ACCOUNT?".

2.Login Page: -

The image shows a mobile app login screen with a blue and white geometric background. At the top, there is a status bar with the time 10:21, a heart icon, and a battery level of 84%. Below the status bar, there is a central illustration of a truck, two cars, and a motorcycle. The word "Login" is centered below the illustration. There are three input fields: the first contains the text "Ramchandra T.", the second is empty and has a blue bar on its left side, and the third contains the text "1234@123". At the bottom, there is a blue button labeled "LOGIN" and a link labeled "DON'T HAVE ACCOUNT".
